

modulo

the evolution of the crawl space

- VENTILATED CRAWL SPACE
- HIGH LOAD-BEARING CAPACITY
- LOGISTICAL ADVANTAGES

MODULO VISION

Humans have always felt the need to live in comfortable houses, experimenting. since the beginning, construction methods to separate the buildings from the ground: Neolithic pile dwellings answered this precise need.

Ancient Romans built elevated floorings to improve air circulation under their houses, eliminating rising damp and at the same time heating the rooms of the upper floors. Today, ventilated foundations are still the best solution to eliminate Radon Gas, a carcinogenic and very harmful gas which is naturally present in the subsoil.

Geoplast has improved these ancient methods in order to allow you to live in healthier and safer buildings.

ANCIENT METHODS FOR NEW NEEDS: HISTORY TAUGHT US HOW TO BUILD WHILE PROTECTING OUR HEALTH

Not only we transform our ideas into innovative and successful products: we are committed also to the study and selection of the most suitable materials in order to guarantee high quality and respect of the environment.

Polypropylene (PP) is a recyclable material that can be obtained from plastic waste regeneration.

Solid and strong, very resistant to both breaking loads and abrasions: regenerated polypropylene is a chemically inert material, neutral to the environment and non-pollutant when in contact with ground or water.

Geoplast S.p.A. in Green Building Council Italy,
The Network for Green Building.

MODULO

SINGLE-USE FORMWORK FOR:

the creation of ventilated foundations.

MODULO is a single-use formwork that eliminates rising damp and **RADON GAS**, that naturally exists in the soil in most parts of the world. **MODULO** allows the construction of a reinforced concrete structure pro-

vided with a slab and a series of pillars placed at a fixed distance. Such a structure permits a uniform stress distribution all over the surface, thus producing an excellent static and dynamic load-bearing capacity.

APPLICATIONS

- VENTILATED CRAWL SPACE
- LIGHTENING OF SLABS
- TECHNICAL VOID SPACE
- FILLING OF SLABS AND FOUNDATIONS
- ACOUSTIC INSULATION MINIMODULO
- COMPENSATION OF SLAB LEVEL
- GREEN ROOF WALKWAYS
- FRIDGE CELLS
- RESTORATION INTERVENTIONS
- VENTILATED ROOFS
- GEOPLAST HOUSING SYSTEM
- STORMWATER MANAGEMENT
- AEROBIC STABILIZATION SYSTEMS

MODULO ADVANTAGES

Modular and single-use formwork system for ventilated crawl spaces for the creation of a physical barrier between the ground and the building

stackable

Unmatched logistical advantages when transporting and storing. At a height of 50 cm, conventional filling requires 50 trucks of filling in comparison to only 1 truck of

MODULO.

light

By far it is the lightest filling solution; the total weight of the cross section is approximately equal to the thickness of the upper slab

high load bearing

Countless pillars, arches and domes create the highest load bearing structure

void space

The void space created under **MODULO** allows an easy installation of electrical as well as mechanical systems. The void space is also perfect for ventilating damp and **RADON GAS** away from the building

fast

When compared with traditional systems, it guarantees a faster installation up to the 80% (in respect to the use of the traditional inert materials)

savings

MODULO system allows savings compared to the use of traditional inert materials, especially in terms of transport and installation

A SUMMARY OF THE TECHNICAL DATA

MINI MODULO

MODULO

MULTI MODULO

ACCESSORIES FOR VENTILATED FOUNDATIONS

GEOBLOCK MODULO

HEIGHT
from 13 to 70 cm

from 0,55 to 4,29 kg

GEOBLOCK MULTIMODULO

HEIGHT
from 13 to 40 cm
WEIGHT PCS.
from 0,37 to 0,98 kg

THE EXTENSION GEOBLOCK

The combination of **MODULO** adjustable product, adaptable to any worksite situation and available for every **MODULO** height. The extension is an

cutting

no **cutting**

■ The **planning**

GEOPLAST offers a planning service on the basis of a DWG analysis of the foundation, in order to obtain a graphic file with an accu-

rate counting of the pieces and a detailed installation scheme.

GEOBLOCK

WHAT ARE THE ADVANTAGES?

A

STRUCTURAL CONTINUITY

single pour of crawl space and foundation beams

B

SAFETY IN THE WORKSITE

It is possible to walk over the formwork, especially along the perimeter, as there is always a complete element

C

ELIMINATION OF THE DOUBLE FORMWORK

thanks to **GEOBLOCK** the beams does not need to be formed internally

D

COMPENSATION ADJUSTABILITY

the depth of **GEOBLOCK** extension can be modified

E

NO CUTTING OF THE FORMWORK

the distances can be compensated without cutting the formwork

SINGLE CONCRETE POUR

The possibility to pour at the same time the crawl space slab and the foundation beams avoids the necessity of installing, pouring and dismantling the formwork for the foundation beams: the construction operations will be reduced to a single pour, with various cost-effective

advantages thanks to **GEOBLOCK**, which works as a side cap of the formwork. Moreover, the single pour produces a higher resistance for the fragile coupling point between the beam and the slab.

- ① Lean concrete
- ② **MODULO** formwork
- ③ **GEOBLOCK**
- ④ Wire Mesh
- ⑤ Concrete slab

ISSUES CAUSED BY RADON GAS

WHAT IS IT?

RADON is an odourless and colourless radioactive gas that can be found in variable quantities in the Earth's crust. The main source of environmental emission of this gas is the soil itself. Radon tends to accumulate in closed, unventilated rooms of

buildings, especially in ground floors. In these areas, **RADON** can reach high concentration levels, which could create very serious health hazards. This problem could be easily prevented if considered at the planning stage of the building.

The origin of Radon in our houses

Source: ©Bob's Radon Mitigation

RISING

Where does it come from?

The soil is a heterogeneous mixture of solid elements, air and water. The last one is the most subject to fluctuation, due to meteoric and groundwater contribution, evaporation and deep percolation. Water can cause serious issues when in contact with a traditional foundation: infiltrations, cold, humid and unhealthy environments, conden-

sation, fungi and mold, as well as the possibility of deterioration of the timber elements of the structure. The direct contact with the ground causes rising damp issues to people and buildings. Rising damp is the most common type of humidity and can be found both in old and new buildings.

RISKS FOR YOUR HEALTH

W.H.O.

**World Health
Organization**

RADON is the second cause of lung cancer after cigarette smoking. The World Health Organization supports this statement and classifies **RADON GAS** as one of the most carcinogenic and harmful substances for humans.

**World Health
Organization**

DAMP

What are the consequences?

- **STATIC DAMAGES:** the salts that can be found in the building material and in the soil melt down in the water. They rise up to the upper layer of the wall and increase their volume up to 12 times. The plaster will start to come off and the entire structure will deteriorate
- **AESTHETICAL DAMAGES:** damp spots or marks, mould, paint that splits apart, deterioration of the structures and of the wooden furniture
- **HEALTH DAMAGES:** the mould feeds on rising damp and releases harmful spores, moreover the places become unhealthy and cold facilitating diseases and physical discomfort

THE VENTILATED CRAWL SPACE

WHY?

It is possible to defend ourselves against **RADON GAS** and rising damp that are all caused due to direct contact with the ground; **VENTILATED FOUNDATION**. This innovative yet simple solution guarantees uniform

and natural air circulation between the ground level and the ground floor. A properly ventilated crawl space avoids contact of the building with the ground, creates an **"EMPTY SPACE"** with many benefits to the building's

health. **GEOPLAST** suggests a specific system for the creation of a ventilated crawl space: **MODULO SYSTEM**.

The history

Even the ancient Romans understood that the direct contact with the ground was not healthy: in fact, they built crawl spaces in order to eliminate rising damp from the building while heating their houses.

The concept of **VENTILATED FOUNDATION**, synonymous with healthy houses, developed in this way.

ADVANTAGES

- RADON GAS MITIGATION
- RISING DAMP ELIMINATION

- BARRIER GROUND/FLOORING
- NO MOULD

HOW IS IT CREATED?

In order to improve the ventilation of the foundation created with **MODULO**, it would be useful to take advantage of the **CHIMNEY EFFECT**. For a proper ventilation, the system should be oriented from North to South or where not possible, from East to West. The greater the difference in height, the greater the air draught. The inlet pipes must

be placed with:

- **INLET**: colder side (**NORTH or EAST**) and close to the ground level (~50 cm)
- **OUTLET**: warmer side (**SOUTH or WEST**) and in a higher position (usually at the height of the inter-floor, if possible).

To guarantee a uniform air circulation, all the areas must be connected together even when interrupted by foundation beam or kerbs. **GEOBLOCK** extensions need to be perforated in order to insert the pipe into the element to connect the crawl space with the outside. The connection must be made with worksite **PVC** pipes.

The air flow can be obtained creating holes of 80/120 mm diameter over the perimetral beams, every 3,50/4,00 m, provided with the **PVC** pipe connection and external stainless steel grids with anti-intru-

sion net. The pipe with the lower inlet must reach half of the formwork in order to guarantee an efficient air channeling and to generate a chimney effect.

The chimney effect

The chimney effect is a natural phenomenon generated within ventilated areas connected with the outside and it is produced by pressure differences. These differences are caused by the air density and the fluids temperature. It

is possible to take advantage of this effect to improve the ventilation of a crawl space, thus creating the ideal air circulation for the elimination of rising damp and the dispersion of Radon Gas in the atmosphere.

LIGHTENING OF SLABS

Thickness of the slab reduced

MODULO is also a lightening system that can offer many benefits. First, it is particularly useful in multi-storey buildings as the total structure becomes lighter with **MODULO** system. This lightness reduces the thickness of the slab, as well as the total load of the structure burdening on pillars and foundations. Sec-

ond, there are savings both in terms of time, labour and material costs, because the amount of concrete and steel used is highly reduced. Finally, thanks to the creation of a void space in multi-storey buildings, **MODULO** ensures noise reduction, heat insulation and an higher living comfort.

Simplified logistics
Heat insulation
Crack prevention

Void space for the passage of technical installation

With **MODULO** it is possible to raise the level of the floor and also create a structural void space that allows the passage of electrical, heating, ventilation, air conditioning and plumbing systems. This space allows an easy and economic functioning of the building. Cables and

pipes can be laid before or after the construction and the maintenance is not invasive. Moreover, the implementation can be done both in new and renovated buildings. The surface is continuous unlike modular raised floors and has a very high load bearing capacity.

High energy efficiency
High load bearing surface
Easy to install systems

FILLING OF SLABS AND FOUNDATIONS

The best filling system

Thanks to its logistical advantages and lightness, **MODULO** is the best filling system. In comparison with traditional filling materials (such as: sand, gravel, etc...), **MODULO** is light-

est since the extra load of the filling is only the concrete that comes on top of the system. Moreover, when used on the roof of a building, it lightens the entire structure, favouring also ventilation.

Quick installation
Economical advantages
Time and material savings

ACOUSTIC INSULATION MINIMODULO

Modulo H6 application example

Thanks to **MODULO H6**, Geoplast manages to reduce the slab noise impact up to 10 dB compared to what would happen in the same building without **MODULO**.

The law disposal, n° 447 dated 26/10/95, on noise pollution establishes the basic principles for the safeguard of the outdoor and indoor settings. As for the building

sector, a Prime Minister's Decree, dated 5/12/97, on the "passive acoustic requisites for the buildings", was published. The decree defines the reverberation time, the apparent soundproofing power of the partition walls, the standardized soundproofing of the facade and the standard level of slabs noise impact.

Acoustic insulation Soundproofing power Reduction of the noise impact

Interval between the frequencies of reference (ISO 717-2)
 Curve of the experimental values without the employment of MODULO H6
 Curve of the experimental values with the employment of MODULO H6
 Curve of the reference values (ISO 717-2)

COMPENSATION OF SLAB LEVEL

An alternative to the traditional inert filling systems

Thanks to its high versatility **MODULO** can be used as an alternative to the traditional inert filling systems. In the offices where the spaces are divided in different levels, **MODULO** is the

perfect solution. It fills the gap between different levels without adding extra weight on the entire structure.

Simplified logistics
High lightening
Labour savings

Walkways to cross the green areas

Green areas have always been an additional value in our cities. In small areas where there is not enough space to use, different levels solutions had to be taken into consideration, the concept

of green roof had to be introduced. Green roofs need walkways to cross the green areas as it happens in our gardens and **MODULO** large range of heights are the best solution.

Load weight reduction
high load bearing capacity
Quick to install

FRIDGE CELLS

Fresh products, stored in safe environments

In warehouses and fridge cells the cold reaches the ground, lowering its temperature to below 0°C. This produces the freezing of the soil, thus increasing the water volume and causing cracks and deformations of the floor. The most cost-

effective and safe solution to this problem is the building of a ventilated foundation between the ground and the building, in order to eliminate moisture infiltrations completely.

No frost heaving
High load-bearing capacity
Technical void space

RESTORATION INTERVENTIONS

The innovative ventilated crawl space

MINIMODULO system is very useful in renovation interventions, as it allows the creation of ventilated floors with mini technical void spaces suitable for hydraulic pipes and electrical installations. The products's heights range permits to intervene also with reduced

thickness, thus avoiding loss of useful height. Moreover, in difficult to access areas, like historical centres, it simplifies logistics and transport as it is space-saving and easy to handle.

Reduced thickness
Moisture elimination
Downstream intervention

VENTILATED ROOFS

Thermal comfort with ventilated roofs

Recently the construction world has increasingly focused on the planning of high energy-efficient buildings with high environmental comfort: this is possible also through the ventilation of roofs and walls. **MINI-MODULO** is ideal for the creation of ventilated surfaces designed to reduce heat

transmission and thermal shock. This system cools down the roof and walls during summer and warms them during winter. The form of the element and the short-distanced feet allow the creation of a ventilation chamber in both directions.

Condensation effect elimination
Ventilation in both directions
Reduced weight of the elements

GEOPLAST HOUSING SYSTEM

High productivity low-cost houses

MODULO is particularly suitable for the creation of pre-fabricated "low cost houses". This is a particularly easy and fast system that improves life quality by separating the floor from the ground thanks to innovative construction methods. **MODULO** can be a winning solution also with last generation timber lodges: their

only weakness is the necessity to create a ventilated foundation in order to thermally insulate the house. The ventilation created with **MODULO** eliminates rising damp protecting and sealing the timber frame.

Costs reduction
Healthy and safe house
Fast construction

STORMWATER MANAGEMENT

Creation of storage tanks with reduced height

MODULO allows the creation of rainwater storage and lamination tanks with a reduced height and a large surface. This is the ideal solution when the groundwater is close to the ground-level or during urban requalification interventions that could modify the

hydraulic system of a certain area. The wide range of heights and the system resistance allow the creation of storage ponds adaptable to any situation.

Reduced digging depth
Good storage capacity
High load-bearing capacity

AEROBIC STABILIZATION SYSTEMS

Optimal treatment of organic waste

MODULO allows the creation of a perforated flooring, with a uniform distribution of the holes all over the surface. This facilitates a uniform diffusion of the air within the waste, in order to optimize the process and obtain a high quality final-product. **MODULO** structure

has an high resistance to loads, allowing the transit of the machinery for the load and unload of the material or for the waste mechanic treatment.

Uniform air diffusion
Quick and easy installation
High resistance to loads

MODULO + GEOBLOCK INSTALLATION

1 PREPARATION

Creation of a laying surface with lean concrete and installation of the external formwork and the reinforcements of the perimetral beams.

2 FACILITIES

Installation of the pipes to place them into the perimetral ventilation holes and then place of the possible channeling systems for the pipes.

3 FORMWORK

Installation of **MODULO** formwork following the instructions, from right to left as marked in the formwork, without any cutting.

4 GEOBLOCK

Installation of **GEOBLOCK** to get closer to the reinforcements of the foundation: in this way **GEOBLOCK** permits the shuttering of the beams.

5 REINFORCEMENT

Installation of the load distribution mesh on **MODULO** formwork and connect it to the foundation beams reinforcement.

6 SINGLE POUR

Pour of the beams and the foundation slabs. Follow the instruction in order to pour correctly.

WARNING

1st ROW

2nd ROW

3^d ROW

MODULO formwork system must be installed FROM RIGHT TO LEFT AND FROM TOP TO BOTTOM, keeping the molded arrows pointing towards and to the left.

It is essential to verify the correct anchoring of the feet!

CONCRETE POURING

After having installed some **MODULO** elements, it is possible to walk on the formwork, being careful to walk only in proximity of the pillars and not directly over the dome. Once the distribution welded wire mesh is placed, the whole surface is walkable. In the case of pumped concrete, keep the pump outlet at a maximal distance of 20 cm from the formwork, in order to avoid

an excessive pressure. The pour should be performed by first filling partially the feet and then the upper part of **MODULO**, not vice-versa. Pour only after the place of the welded mesh and after having verified the correct installation of the formwork.

Stage 1

Partially fill **MODULO** feet

Stage 2

Partially fill all kerbs and foundation beams

Stage 3

Complete the pour of the feet, kerbs and foundation beams

DURING SUNNY DAYS WITH TEMPERATURES OF ABOUT 30°C, IT IS RECOMMENDED TO POUR IN THE COOLEST HOURS OR TO SOAK THE FORMWORK

DESIGN & ASSISTANCE

From predimensioning to load tests

Our technical unit is at your complete disposal .

OUR STRENGTHS ARE:

- FEASIBILITY ANALYSIS
- PREDIMENSIONING OF THE STRUCTURES
- ASSISTANCE DURING THE EXECUTIVE DESIGN

ANALISI F.E.M.

The **F.E.M.** analysis (**Finite Element Method**) allows the study of structures built with **MODULO** system. The research shows that the system's leg has a

solid body behaviour: that means that the system is not subjected to bending nor torsional strains.

Tension stress diagram

Study results

- SOLID BEHAVIOUR
- REDUCED SYSTEM DEFORMATION
- DOES NOT NEED REINFORCEMENT FEET
